ACE DuraFlo cures beach community's problem

Situated on the shores of the Pacific Ocean the residents of this Southern California community have something in common besides fresh ocean breezes, beaches, golf and warm Californian evenings. They also share a wide spread problem - failing copper pipes.

The Problem:

A local leak detection service reports that they receive on average 17 calls per day to locate leaks from failing copper pipes in the area. Yes, 17 every day in this community of just under 8,000 households. If that statistic holds up it would suggest that within a year over 1/3rd of all the households in this Southern California community will be faced with a leak from failing copper pipes. Non-uniform corrosion of the copper pipe is their biggest problem.

Across the nation and more specifically back in Southern California, plumbers, homeowners, insurance companies all wonder what is happening to copper pipe and what can be done about those horrendous pinhole leaks.

Over the past year nearly 15% of all households in this Southern California community have opted for a "friendly, non-intrusive, long-term" solution to fixing their problems of failing copper pipe.

The Solution:

Those homeowners chose to have their copper pipes restored by the ACE DuraFlo system, rather than face another pinhole leak or the prospect of a messy and expensive repipe.

The ACE DuraFlo system restores pipes "in-place" by installing a permanent epoxy barrier coating to the inside of the piping system – in effect creating a new corrosion resistant pipe inside the existing piping system. During the ACE DuraFlo process typically no walls are cut open and the process can be completed in less than 2 days per home.

The ACE DuraFlo process is ANSI/NSF Standard 61 approved for use with drinking water systems and is listed by the Uniform Plumbing Code (UPC) for application to both copper and steel piping systems.
